

Rafiq decides for itself

A quick brief before we open the editor: what changes, what's new, and how it's wired into EP01 and EP02.

01 Brief

Since EP02, Rafiq has always searched company documents before answering — even for questions that had nothing to do with the company. Today it gets a decision step: for every question, it first checks whether it can answer confidently on its own. If not, it searches. If nothing relevant turns up either, it says so instead of guessing.

On top of that, Rafiq can now learn from a file **uploaded on the spot** — and answer strictly from that file alone, with company documents and general knowledge both switched off for that question.

02 Packages

Only one new package this episode — the intelligence here comes from how the pieces are wired, not from new tools.

python-multipart

Required by FastAPI to accept file uploads. Without it, an upload endpoint simply won't work.

Nothing else changed: the same OpenAI client, the same Chroma setup, the same chunking logic from EP02 are all reused as-is. This episode is about decision-making and one new entry point, not new infrastructure.

03 Architecture — the decision

Every question now passes through one question first: **can this be answered confidently without looking anything up?**
